

OVERVIEW

In today's advanced world, data is your most valuable asset, and its security is non-negotiable. At PCS Global, we combine cutting-edge technology, robust processes, and world-class expertise to safeguard your information—from endpoint to cloud. Our holistic, multilayered approach ensures business continuity, compliance readiness, and unwavering data assurance.

HOW PCS GLOBAL SECURES YOUR DIGITAL ECOSYSTEM

ENTERPRISE-READY, INTERNATIONALLY COMPLIANT IT INFRASTRUCTURE

PCS has a robust IT infrastructures that meet global security benchmarks. From ISO-certified data centers to GDPR- and HIPAA-ready deployments, every component is architected for resilience, performance, and regulatory alignment so your clients' data is secured and protected.

PCS NETWORK ARCHITECTURE

The PCS network architecture is built for robust security and efficient management, starting with a firewall-protected entry point that uses static IP whitelisting to tightly control incoming traffic. Within the internal network, enterprise-grade switches and managed DHCP servers ensure that only authenticated devices receive IP addresses, segmenting and isolating traffic for added protection. Critical servers and NAS units operate on static IPs, allowing for streamlined monitoring and strict access control. Additionally, dynamic DHCP state management tracks sessions in real time, effectively preventing IP spoofing and unauthorised device connections.

Firewall-Protected Entry Point

DHCP, Wired LAN, and Secure Switching

Server & NAS Deployment

Dynamic DHCP State Management

FIREWALL AND PERIMETER SECURITY

PCS's firewall and perimeter security framework ensures uninterrupted, secure connectivity through redundant static IP uplinks via ISP and a Backup ISP, providing robust failover protection. Advanced intrusion prevention systems (IPS) & next generation firewalls continuously check & analyze network traffic to detect & block zero-day exploits. Complementing this, the gateway security architecture integrates secure reverse proxies and web application firewalls (WAFs), offering comprehensive defense against DDoS threats and OWASP-listed vulnerabilities for all public facing services.

DEVICE & DATA FLOW SECURITY

PCS enforces stringent role-based access & authentication protocols by leveraging multi-factor authentication (MFA) & least-privilege policies to ensure users access only the resources they're authorized for. All internal communication between devices & servers is secured using TLS 1.3 and AES-256 encryption, safeguarding data in transit. The wired infrastructure is tightly secured through controlled switches, DHCP, and server configurations, with locked-down physical ports and VLAN segmentation that restrict access to sensitive subnets exclusively to designated devices.

Role-Based Access & Authentication

Encrypted Communication Between Devices

Secured Wired Infrastructure (Switch + DHCP + Server)

SECURE DATA STORAGE

PCS ensures data integrity and resilience through encrypted network-attached storage (NAS), with all data at rest secured and backed up on an immutable schedule, including off-site replicas for disaster recovery. Server access is tightly controlled, with administrative consoles restricted to predefined IP ranges, significantly minimizing the external attack surface. Additionally, sensitive data is routed exclusively within PCS Global's private internal network, never traversing the public internet, thereby maintaining strict confidentiality and control over critical information flows.

NAS Encryption & Backup Protocols

Controlled Server Access (IP-Restricted)

Internal-Only Data Routing

COMPLIANCE & BEST PRACTICES

PCS upholds an international compliant security framework by aligning with global IT security standards such as ISO 27001 & NIST CSF, ensuring a resilient & auditable security posture. Our infrastructure is designed to support environments governed by GDPR, HIPAA, & ISO requirements, making us suitable for industries like healthcare, finance & international operations. To maintain peak security performance, we conduct regular audits including quarterly penetration tests, monthly vulnerability scans & continuous patch management, ensuring proactive defense against evolving threats.

Adherence to International IT Security Standards

Built for GDPR, HIPAA, and ISO-Aligned Environments

Regular Audits & Upgrades

Let's build your future-ready IT backbone.
